Food Chains

Match the keywords to the correct definitions.

producers

primary consumers

secondary consumers

predators

prey

scavengers

decomposers

1. These are usually herbivores which feed on the plants.

2. These are organisms which kill for food. They are secondary or tertiary consumers.

3. Convert the sun's energy into useful compounds through photosynthesis. They are green plants or algae.

4. These are the animals which are eaten by the predators.

5. These organisms feed on dead and decaying organisms. They break down the biomass and release nutrients into the soil.

6. These are usually omnivores or carnivores and feed on the primary consumers.

7. These organisms feed on dead animals (carrion).

Design your own food chain for one of the following:

- An animal that lives in the sea
- An animal that lives in the jungle
- An animal that live in the desert
